Model Tables

Jan 2025

Survey Period

3 model tables: FactSurveyResponse · DimEmployee · DimDate

Data Preparation- Power Query Applied Steps

- Source: 300 raw records → 299 unique respondents (1 duplicate Employee_ID E0151 removed via Remove Duplicates)
- 6 Progression values of 0 replaced with null- outside the 1-5 valid scale; treated as missing data, not zero
- Response Date: UK locale applied- source file used US date format (MM/DD/YYYY)
- Age Group Sort column added- numeric key (1–5) so '<25' orders correctly; text sort would misplace it last
- Inclusion Score: List.Average of 5 dimensions- handles nulls correctly; 6 null Progression rows average 4 available dimensions
- All demographic columns renamed for clean display (Disability_Status, Manager_Fairness, Age_Group, Speak_Up)

Data Modelling- Why a Star Schema?

- Flat tables are loaded files, not models. A star schema enforces correct filter propagation and scalable design
- FactSurveyResponse: one row per respondent- holds all 5 scores, Response Date, Employee_ID (FK)
- DimEmployee: one row per employee- all demographic attributes (Grade, Gender, Ethnicity, Department etc.)
- DimDate: one row per date- supports year-on-year trend analysis if survey runs annually
- All KPIs built as DAX measures (not calculated columns)- evaluate correctly in any filter context
- Relationships: Many-to-One, single direction (Facts → Dimensions)- prevents circular filter issues

Data Limitations- What This Data Cannot Tell Us

TECHNICAL

Part 1 of 2- Technical audience

Unknown response rate

299 responses from an unknown total workforce. Non-respondents may hold the most extreme views- a systematic non-response bias that could mean findings understate reality.

Cross-sectional- no trend data

Single snapshot, January 2025. Cannot determine whether scores are improving or worsening, cannot establish causality- only association between demographics and scores.

15% non-disclosure on ethnicity

~45 respondents chose 'Prefer not to say'. Those with most negative experiences may feel least safe disclosing identity- ethnic disparity findings likely understate reality.

Single-item measures

Each dimension is one survey question. 'Progression' as a complex construct is measured by a single item- limiting construct validity. Direction is reliable; precision is not.

Likert scale treated as continuous

Ordinal scales- the gap between 1 and 2 may not equal 4 to 5. Means assume equal intervals. Standard analytical practice, acknowledged as an approximation.

Small demographic groups

Non-binary (n=10) at suppression boundary- directionally indicative only. Disabled respondents (n=32) are reportable but carry wide confidence intervals.

Suppression Policy- Governance Built Into the Model

- Threshold: groups of n<10 not reported independently- protects individual anonymity
- Non-binary gender (n=10): at suppression boundary- presented as directionally indicative with explicit caveat on every chart
- Intersectional cuts suppressed where rare combinations risk re-identification of individuals
- Group Size Label DAX measure: evaluates COUNTROWS in current filter context- returns suppression warning automatically when n<10. Governance embedded in the architecture, not added as afterthought
- Prefer not to say groups retained across all demographics- non-disclosure is an inclusion signal, not missing data to exclude

Why build a Governance measure?

IF(COUNTROWS('FactSurveyResponse') < 10, ' Suppressed', 'n = ' & COUNTROWS(...)). Responds to every slicer and drill-through- if a panel member selects a small group during Q&A, the suppression warning fires automatically before any misleading figure could be read.

Ethical Responsibilities in Reporting

- Anonymisation: all outputs are aggregate- individual-level data not distributed under any circumstances
- Re-identification risk: intersectional cuts suppressed where rare combinations could identify individuals
- Framing: disparities presented as institutional patterns, not individual characteristics- language choices matter
- Accessibility: all visuals include alt text; colour coding always paired with text labels (not colour alone)- WCAG-compliant
- Non-disclosure: 15% 'Prefer not to say' on ethnicity named explicitly as potential understatement- not hidden
- Feedback loop: employees who completed the survey must be informed of findings and what will change. Failing this is the primary reason survey participation falls in the next cycle
- Qualitative follow-up: statistical findings should not drive intervention design alone- lived experience data essential

Overall Inclusion Picture- Where We Are

LEADERSHIP

Inclusion Dimensions - Organisation Overview

Respondent by Gender

Respondent by Ethnicity

Data: Employee Experience & Inclusion Survey, Jan 2025 | Group < 10 Suppressed | n=299

Overall Inclusion Score

2.98

out of 5.0

Target: 3.5 / 5.0

- No dimension reaches the 3.5 target- all in amber band
- Progression (2.76) is the lowest and most urgent concern
- Manager Fairness highest- line managers not the primary driver
- Challenge is structural barriers, not management or welcome culture

Progression- The Most Urgent Inclusion Risk

LEADERSHIP

Part 2 of 2- Senior HR leadership

43% of all employees rate their progression experience negatively- the lowest scoring dimension of all 5

Progression Response Distribution by Gender

Data: Employee Experience & Inclusion Survey, Jan 2025 | Group < 10 Suppressed | n=299

People feel welcomed into this organisation- they do not feel they can progress within it. The problem is structural, not cultural.

Secondary Findings Requiring Leadership Attention

LEADERSHIP

Part 2 of 2- Senior HR leadership

STEM

Authenticity: 2.74

Lowest of all departments. 0.63 gap vs Digital Services (3.37). Staff feel unable to bring their full selves to work in a technical environment- a direct organisational risk.

WELS

Speak Up: 2.96

Lowest psychological safety of all departments. A potential silencing pattern that needs investigation before it becomes entrenched.

Positive

Black (3.15) and Asian (3.09) employees report higher Belonging than White British (2.84). People feel welcomed- the barrier is structural, not cultural.

STEM: Authenticity at 2.74- a 0.63 gap vs Digital Services. In a technical environment where diverse thinking drives innovation, psychological safety is not a soft issue- it is a direct performance risk.

WELS: Speak Up at 2.96- lowest department on psychological safety. A silencing pattern whether from management style, workload, or culture. Requires targeted listening before it becomes entrenched.

Positive: Black (3.15) and Asian (3.09) employees report higher Belonging than White British (2.84). The intervention must focus on structural progression- not culture. People feel welcomed already.

Three Priorities for Leadership Action

LEADERSHIP

Part 2 of 2- Senior HR leadership

01

HIGH PRIORITY

Progression Equity Audit

What

Commission a structured qualitative follow-up with women, ethnic minority staff, and under-25 employees- the three groups showing the largest progression gaps (female 2.69, Black 2.64, under-25: 2.62).

Why

The data shows where the gap exists. Only direct conversation reveals whether the barrier is access to stretch opportunities, sponsorship, promotion panel composition, or process design. Without this, any intervention risks targeting the wrong lever.

Timeline: Within 3 months

02

MEDIUM PRIORITY

Department Listening Sessions

What

STEM and WELS leaders facilitate structured listening sessions addressing authenticity (STEM: 2.74) and psychological safety (WELS: 2.96) in their teams specifically.

Why

Aggregate data cannot explain a department-level pattern. Culture, management approach, or structural factors may all contribute. Listening sessions produce the qualitative context needed to design targeted, effective responses.

Timeline: Within 2 months

03

IMMEDIATE

Close the Feedback Loop

What

Communicate key findings back to all 299 respondents- share what was heard and what the organisation commits to doing. Include the positive Belonging signal alongside the Progression risk.

Why

Survey participation is built on trust. Employees who gave their time expect to know what happened. Failing to close this loop is the single most common reason participation falls in the next survey cycle.

Timeline: Within 4 weeks

The data tells us where the gaps are. The qualitative follow-up will tell us why- and that is where the real leverage for change lives.
